This editorial aims to answer the question of whether infection control is an academic specialty. By considering the consequences of a lack of infection control in terms of patient morbidity and mortality and hence cost, it is easy to establish the importance of the area. Infection control embraces not only developing policies for preventing the physical spread of a microorganism but also prophylactic therapy such as vaccination and therapeutic measures such as antibiotics. Infection control not only applies to localized infection in hospital due to antibiotic resistant microbes but also to the community. Bacteria such as Helicobacter pylori and Chlamydia pneumoniae and the viruses Hepatitis B, Hepatitis C, human lymphotropic virus type 1, Epstein-Barr viruses and human papilloma virus have been implicated in diseases not previously thought to have an infectious origin. Coping with these problems is clearly an academic area.

AIM: To develop a polymerase chain reaction enzyme immunoassay AB (PCR-EIA) to measure levels of circulating aspergillus DNA in invasive aspergillosis caused by Aspergillus fumigatus. METHODS: The PCR reaction was based on primers from the 18s rRNA gene. Binding of the product to a streptavidin coated microtitration plate was mediated by a biotinylated capture probe. The product was digoxigenylated during PCR and this was the tag to which antibody was bound in the subsequent EIA. RESULTS: The optical density (OD) endpoint was < 0.1 in 10 sera from neutropenic patients with no evidence of invasive aspergillosis, and in 10 sera from nonneutropenic patients with bacterial pneumonia (group 1). The OD from five of 12 patients with allergic bronchopulmonary aspergillosis (ABPA) (group 2), three with an aspergilloma (group 3), and five with possible invasive aspergillosis (group 4) was > or = 0.1. In 63 sera from 33 cases of proven invasive aspergillosis (group 5) an OD > or = 0.1 was achieved in 48 sera from 30 patients. The maximum OD was 0.510. The level fell in survivors and gradually

> 308-4994 Searcher : Shears

rose in fatal cases. CONCLUSIONS: This assay validated the concept of diagnosing invasive aspergillosis by measuring levels of circulating fungal DNA in serum.

Objective: To evaluate the importance of cervical cancer in the spectrum of human immunodeficiency virus (HIV) related diseases at a single high-risk institution and to compare disease characteristics in HIV-infected women with cervical cancer and those with other AIDS-related malignancies. Methods: We retrospectively reviewed data on cervical cancer and AIDS in women registered through the New York City Department of Health and institutional tumor registries from 1987 through 1995. Results: During the study period, cervical cancer was diagnosed in 28 HIV-positive women. In 26, cervical cancer was the initial AIDS-defining illness, representing 4% (26 of 725) of the subjects, and it was the sixth most common initial AIDS-defining illness in women. Cervical cancer was the most common AIDS-related malignancy among women, representing 55% of the cases, followed by lymphoma (29%) and Kaposi sarcoma (16%). In 71% of the women with cervical cancer, HIV infection was diagnosed at the time of cancer presentation by routine testing, whereas in women with other malignancies, HIV diagnosis preceded cancer diagnosis (70%) by a mean of 2.7 years. Patients with other malignancies had greater immunosuppression (mean CD4 count 153/.mu.L) than those with cervical cancer (mean CD4 count 312/.mu.L). The recurrence rate for women with cervical cancer was 88%. Although the interval from cancer diagnosis to death was similar in all three groups (9.1-12.4 months), cancer was the cause of death in 95% of HIV- infected women with cervical cancer, compared with 60% of those with other AIDS-related malignancies. Conclusion: In urban populations at increased risk for both diseases, cervical cancer is an important AIDS-defining illness and may be the most common AIDS-related malignancy in women.

DOCUMENT TYPE: Article LANGUAGE: English

AB Aim: To improve the diagnosis of culture negative endocarditis by diagnosing cases due to streptococci and enterococci. Method: Serum samples were immunoblotted against extracts of the commonest streptococci and enterococci. They were selected from patients with a cardiac murmur, persistent pyrexia and at least three negative blood cultures. The presence of patterns of endocarditis species specific antigenic bands was measured and correlated with clinical outcome. Results: Negative serology was found in 28 patients where the diagnosis of endocarditis was rejected or, if proved, staphylococcal, yeast, Gram negative, systemic lupus erythematosus,

due to Q fever or Chlamydia psittaci or nonbacterial thrombotic. Positive serology was found in 27 of the 34 patients where the response to antibiotics suggested streptococcal or enterococcal infection. In 22 of these there was objective evidence of endocarditis. Positive serology was also found in three of four further patients with vegetations at necropsy. Conclusion: The identification of patterns of antibody response on immunoblotting can be used to make a specific diagnosis of streptococcal or enterococcal endocarditis in the absence of positive blood cultures.

\*ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS\* Natural genetic transformation is the active uptake of free DNA AΒ by bacterial cells and the heritable incorporation of its genetic information. Since the famous discovery of transformation in Streptococcus pneumoniae by Griffith in 1928 and the demonstration of DNA as the transforming principle by Avery and coworkers in 1944, cellular processes involved in transformation have been studied extensively by in vitro experimentation with a few transformable species. Only more recently has it been considered that transformation may be a powerful mechanism of horizontal gene transfer in natural bacterial populations. In this review the current understanding of the biology of transformation is summarized to provide the platform on which aspects of bacterial transformation in water soil, and sediments and the habitat of pathogens are discussed. Direct and indirect evidence for gene transfer routes by transformation within species and between different species will be presented, along with data suggesting that plasmids as well as chromosomal DNA are subject to genetic exchange via transformation. Experiments exploring the prerequisites for transformation in the environment, including the production and persistence of free DNA and factors important for the uptake of DNA by cells, will be compiled, as well as possible natural barriers to transformation. The efficiency of gene transfer by transformation in bacterial habitats is possibly genetically adjusted to submaximal levels. The fact that natural transformation has been detected among bacteria from all trophic and taxonomic groups including archaebacteria suggests that transformability evolved early in phylogeny. Probable functions of DNA uptake other than gene acquisition will be discussed. The body of information presently available suggests that

Searcher: Shears 308-4994

transformation has a great impact on bacterial population dynamics

as well as on bacterial evolution and speciation.

AB The in vitro activity of two new quinolone antimicrobials, rufloxacin (I) and MF 961 (II), together with the desmethylated metabolite of rufloxacin (MF 922) were compared with other orally administered agents against 622 bacterial strains. Against

Enterobacteriaceae and Pseudomonas aeruginosa, I was generally active (MIC90 1-8 mg/L) with the exception of Klebsiella and Serratia spp. (MIC90 32 mg/L) and Enterobacter spp. (MIC90 64 mg/L). The respiratory pathogens Haemophilus influenzae and Moraxella catarrhalis were susceptible to I (MIC90 0.5 and 1 mg/L, resp.), but Streptococcus pneumoniae was less susceptible (MIC90 32 Staphylococcus aureus was susceptible to I (MIC90 2 mg/L). The I metabolite, MF 922, was generally as active as its parent. II was usually 2-fold more active than I. All 3 compds. were 4-16 times less active than norfloxacin, but I was as active or somewhat more active than norfloxacin against Staphylococcus spp. Any strains showing decreased susceptibility to other quinolones exhibited cross resistance to these new agents. The MBC of I and MF 922 was within one diln. of the MIC, and human serum had little effect upon the activity of both agents. The protein binding of I and MF 922 at 1 and 10 mg/L was 55 and 63.8% and 30.3% and 32.6%, resp. The activity of rufloxacin against four strains of Chlamydia trachomatis and one strain of Chlamydia pneumoniae was The MIC for C. trachomatis was 4-8 mg/L and 4 mg/L for C. pneumoniae.

AB The flavodoxins constitute a highly conserved family of small, acidic electron transfer proteins with flavin mononucleotide prosthetic groups. They are found in prokaryotes and in red and green algae, where they provide electron at low potentials for the reduction of nitrogen by nitrogenase, for the light-dependent reduction of NADP+ in photosynthesis, and for the reduction of sulfite. Proteins with the physical characteristics of flavodoxins

have been implicated in the reductive activation of pyruvate formate-lyase and cobalamin-dependent methionine synthase in Escherichia coli. We have purified flavodoxin to homogeneity from E. coli, determined its N-terminal amino acid sequence, and used this sequence to construct a 64-fold degenerate oligonucleotide probe for the flavodoxin gene. Because the phenotype of a flavodoxin mutant is not known, we used this degenerate probe to screen the phages of Kohara library and identified two phages, with inserts mapping at .apprx. 16 min, that hybridized to the probe. The flavodoxin gene, designated fldA, was subcloned from the DNA in the overlap region of these two clones. The deduced amino acid sequence, determined by nucleotide sequencing of the flavodoxin gene, shows strong homology with flavodoxins from nitrogen-fixing bacteria and cyanobacteria. The fldA gene maps at 15.9 min on the E. coli chromosome and is transcribed in a counterclockwise direction.

AB A modification of an immunofluorescence method previously used to study the in vitro antimicrobial susceptibilities of C. trachomatis was used to investigate the activity of seven antimicrobials against a strain of C. pneumoniae. Adding antimicrobial to preinfected cells gave higher MICs (min. inhibitory concns.) and MLCs (min. lethal concns.) than when cells were infected in the presence of the antimicrobials, and this difference in methodol. could account for the discrepancy between these results and those of

others. Of the antimicrobials studied, clarithromycin and its 14-hydroxy metabolite were the most active agents; sparfloxacin was more active than ciprofloxacin, but no more active than more conventional antichlamydial agents.

AB Serum samples from patients with endocarditis due to Streptococcus mutans, Streptococcus pneumoniae, Streptococcus agalactiae, Streptococcus lactis and a "nutritionally" variant streptococcus were immunoblotted against antigenic extracts from all five species. In S mutans endocarditis there was an endocarditis specific pattern of IgM against bands of 220, 200, and 190 kilodaltons. In S pneumoniae IgM against antibody of a molecular weight greater than 150 kilodaltons was specific to endocarditis. In S agalactiae IgM against bands at 82, 71, and 66-67 kilodaltons was endocarditis specific. In S lactis endocarditis specific IgM was present against antigenic bands at 105, 66, 61 and 58 kilodaltons. With the "nutritionally" variant streptococcus it was impossible to distinguish between cases of endocarditis and

The in vitro activity of sparfloxacin (AT-4140), a new difluorinated AB quinolone, was compared with those of ciprofloxacin, temafloxacin, and selected members of other groups of antimicrobial agents, against 651 recent distinct clin. isolates and strains with known mechanisms of resistance. Three strains of Chlamydia trachomatis were also studied. The MICs for 90% of the Enterobacteriaceae were 0.06-1 mg/L; for Pseudomonas aeruginosa the MIC90 was 2 mg/L. Sparfloxacin was 16-fold more active against Acinetobacter spp. than ciprofloxacin. For Staphylococcus spp., Streptococcus spp., and Enterococcus faecalis, the MIC90 was 0.25-1 mg/L; sparfloxacin was 4-fold more active against Streptococcus pneumoniae than ciprofloxacin. Ninety percent of strains of Haemophilus influenzae, Branhamella catarrhalis, and Neisseria spp. were inhibited by <0.03 mg/L; for Bacteroides fragilis the MIC90 was 1 mg/L. The 3 strains of C. trachomatis were susceptible to 0.06-0.12 mg/L sparfloxacin, which was 16-fold more active than ciprofloxacin. There was cross resistance among the quinolones, but not between the quinolones and other groups of antimicrobials. The protein binding of sparfloxacin was 40% and serum had little effect on its activity.

AB The in vitro activity of lomefloxacin (I), a new difluorinated quinolone, was compared with those of ofloxacin, ciprofloxacin, fleroxacin, amoxicillin, cefuroxime, and trimethoprim against 585 recent clin. isolates and other strains with known mechanisms of resistance. The MICs of I against 90% of the members of the family Enterobacteriaceae, Pseudomonas aeruginosa, and staphylococci were between 0.25 and 4 .mu.g/mL. Ninety percent of Neisseria sp. and Haemophilus influenzae were susceptible to .ltoreq.0.06 .mu.g/mL, and streptococci (including S. pyogenes, S. pneumoniae, and enterococci) and Bacteroides feragilis were susceptible to 8 .mu.g/mL. I was comparable in activity to fleroxacin and ofloxacin, but it was less active than ciprofloxacin. There was

cross-resistance between the quinolone group of antimicrobial agents. The protein binding of I was 15.4%, and serum had little effect on the activity of the compd. However, urine at pH 5.0 decreased the activity by 2-8-fold compared with that at pH 7.0.

This paper reports the case of a five-week-old child who developed severe rhinitis with epistaxes, due to infection with chlamydia trachomatis. The infection was acquired from the mother's genital tract during birth but the true diagnosis was not suspected for some time. Chlamydia trachomatis is well recognized as one of the causes of neonatal conjunctivitis and pneumonia. However, its presence in the upper respiratory tract is thought usually to be asymptomatic (Oriel and Ridgway, 1982). Little attention has been focused on its role in neonatal rhinitis. This paper draws to the otolaryngologist's attention the entity of chlamydial rhinitis neonatorum and discusses the epidemiology, diagnosis and management of the condition.

LANGUAGE: A pneumococcus resistant to chloramphenicol, tetracycline and penicillin was isolated from a holidaymaker from Spain, who was admitted to hospital in Plymouth with an acute skin condition. She had a productive cough, and from mucopurulent sputum a pneumococcus (type 23, Danish nomenclature) was isolated. On routine testing this was found to be resistant to choramphenical and tetracycline, and the zone of inhibition round the penicillin disc (1.5 units) was reduced from the expected .gtoreg.10 mm to 7 mm, measured radially from the edge of the disc. By the agar dilution method, using a minimal-growth endpoint, the minimum inhibitory concentration (M.I.C.) of penicillin was 0.25 .mu.g/ml compared with an M.I.C. of 0.03 .mu.g/ml for a sensitive strain. The M.I.C.s of tetracycline and chloramphenical were both 20 .mu.g/ml. The inoculum used in these tests was about 106 organisms.

                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABLIG511), expressed DNA sequences (ABLIG175) and the encoded proteins (ABB57037-ABB72072).

(ABB57737-ABB72077), but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                           25-MAY-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, haematopoiesis regulating activity intibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                    Human; cytokine; cell proliferation; cell differentiation; gene th vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia;

```
The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM73323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, inmunomodulatory activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-SEP-2000; 2000US-0663561

                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 36
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal
                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

In an exemplification of the invention, the expression profile of representative genes was examined in a rat model of polycystic kidney disease and compared with gene expression in normal rats. The PTBR gene (also referred to as clone PO242) was found to be overexpressed by a factor of 2 in the rat model of PKD, while the DBI gene was underexpressed by a factor of 1.9. The present sequence represents the amino acid sequence of human PTBR.
Note: The present sequence is not given in the specification although it is referred to as SEQ ID NO:3 and is stated as being given in figure 2.
This sequence was obtained using the DNA sequence given in figure 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hypertrophic cardiomyopathy; restrictive cardiomyopathy; mitral valve disease; aortic valve disease; tricuspid valve disease, angina pectoris; myocardial infarction; cardiac arrhythmia;
                                                                                                                                                                                                                                                                                                           18-DEC-1998;

expression

Sequences AAB37984-B38019 represent the amino acid sequences of 27 human secreted proteins encoded by the genes AAC69084-C69119. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic diagnosis, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital.

These genes include I-8U, prostacyclin stimulating factor, isf-2, tissue specific mRNA, insulin-like growth factor binding protein 6, OSF-1, gas-1, YMP, BTG2, pre-B cell stimulating factor homologue (SDF1a), peripheral benzodiazepine receptor, and cellular ligand of annexin II (pl1), respectively. These diseases include congenital heart failure, dilated congestive cardiomyopathy, ypertrophic cardiomyopathy, restrictive cardiomyopathy, mitral valve disease, aortic valve disease, tricuspid valve disease, angina pectoris, arterial hypertension, renovascular hypertension, arteriosclerosis,

                                                                                                                    This is the amino acid sequence of the peripheral-type benzodiazepine receptor, derived from the human breast cancer cell lines, MCF-7 and MDA-231. The amino acid sequence differs from the wildtype PBR sequence with the replacement of histidine 162 with arginine and replacement of alanine 147 with a threonine.

This invention provides the means of Peripheral-type benzodiazepine
                                                                                                                                                                                                                                                                                                                      Agents
useful
                                   receptor (PBR) modulation.

Molecules that inhibit PBR function are used to treat diseases mediated by increased cell proliferation, particularly cancers (e.g. mediated by increased cell proliferation, particularly cancers, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, testes, pancreas, live cancers of the lung, stomach, prostate, overy, live cancers of the lung, stomach, prostate, live cancers of the lung, stomach, live cancers of the lung, stomach, live cancers of the live cancers of the lung, stomach, live cancers of the lung, stomach, live cancers of the lung, stom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer; cell proliferation; invasive tumor; aggressive tumor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8 × 6 6 6
      Qy
The invention relates to a method for the treatment and prevention of CC diseases that involve cyst formation, particularly polycystic kidney Cd diseases (PKD), comprising administering a ligand of a peripheral-type CC disease (PKD), comprising administering a ligand can also be used for the CC treatment of hypertension associated with PKD. The invention also cencompasses the diagnosis and/or prognosis of cystic disease, or the CC diagnosis of a predisposition to cystic disease, via the monitoring of CC changes in expression levels of PTBR or an endogenous ligand of PTBR, CC such as the diazepam binding inhibitor (DBI). In PKD, the PTBR gene is CC overexpressed, while the natural ligand is underexpressed. The PTBR CC ilgands of the invention inhibit the proliferation of epithelial cells. CC from PKD kidneys, i.e., they arrest cell growth but do not kill cells. CC The method is used to treat diseases associated with cyst formation, particularly both the autosomal dominant and recessive forms of PKD. The methods can also be used for the diagnosis and prognosis of a cystic disease or susceptibility to it. The methods may also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
